## Falk Lifelign Gear Coupling Application Guide

**Type GC02 & GC05**

With two hubs and one sleeve, the simplicity of this continuous sleeve coupling allows it to be easily adapted to a wide variety of applications. It's very compact, low in rotating mass, and has a lower initial cost than flanged types. (See **pages 12 and 13.**)

**Type GC05 Floating Shaft**

Floating shaft assemblies are used when the distance between equipment is too great for spacer couplings. A standard floating shaft assembly consists of two standard single engagement couplings and a connecting shaft. A floating shaft can eliminate the need for additional bearing supports along spanning shafts, because the shaft is supported by connected equipment through the single engagement couplings. (See **page 14.**)

**Types G20, GV20**

**Type G Large Gear Coupling**

The Type G20 double engagement, close-coupled type has two flex halves to accommodate both offset and angular misalignment or a combination of the two, as well as end float. It is ideal for all horizontal, close-coupled applications including fans, overhead cranes, conveyors, steel and paper mill equipment. It is adaptable with limited end float kits for use on electric motors, generators or any machines fitted with sleeve or straight roller bearings. (See **page 15.**)

Type GV20 vertical double engagement coupling is a standard horizontal double engagement gear coupling modified to accommodate the sleeve-centering assembly. Recommended for inclinations over 10°. (See **pages 20 and 36.**)

The Type G Large Gear Coupling is available in all types for capacities up to 72,450,000 lb-in, 8,185,000 Nm. (See **page 33.**)

**Types G32**

Spacer couplings for pump and compressor applications simplify servicing connected equipment. Spacer couplings use a standard double engagement coupling with a spacer tube and an additional set of fasteners. Stock spacer lengths for quick delivery are available in the popular sizes. Special lengths are also available. (See **page 16.**)

## Falk Lifelign Gear Coupling Application Guide

Types G52, GV52

The Type G52 single engagement design is used with floating shafts or three bearing drive trains. It has one flex half and one rigid half and only accepts angular misalignment. (See **pages 17 and 34.**)

The GV52 vertical single engagement gear coupling is a standard horizontal single engagement gear coupling modified to accommodate the sleeve-centering assembly. It is recommended for inclinations over 10°. Downward thrust capacity for Sizes 1010 thru 1030GV52 is 10,000 lbs.; for Sizes 1035 thru 1070GV52, it is 30,000 lbs. and for Sizes 1080GV52 and larger, it is 87,000 lbs. (See **pages 21 and 37.**)

Types G52, GV52

Floating shaft assemblies are used when the distance between equipment is too great for spacer couplings. A standard floating shaft assembly consists of two standard single engagement couplings, two gap discs and a connecting shaft. A floating shaft can eliminate the need for additional bearing supports along spanning shafts, because the shaft is supported by connected equipment through the single engagement couplings. (See **pages 18, 19 and 35.**) When used with a vertical floating shaft on inclinations over 10°, the Type GV52 coupling is used as the lower coupling to support the shaft. (See **pages 21 and 37.**)

Flex Hubs on Floating Shaft (RFFR) — Assembly of the flex hubs on the floating shaft allows for easier replacement and allows the rigid hubs with greater bore capacity to be used on the connected equipment shafts. This frequently means a smaller coupling size can be utilized.

Rigid Hubs on Floating Shaft (FRRF) — When the rigid hubs are on the floating shaft, shorter shaft spans can be accommodated, since no cover drawback is required.

Types G62 & 66

Type G63

Double or single engagement brakewheel and disc brake couplings are used for applications such as cranes, hoists and conveyors. Brakewheel and disc brake couplings accommodate misalignment between connected equipment and eliminate the need for double shaft extensions on motors and gear drives for applications requiring brakes. (See **pages 22 and 23.**)

Types GL20 & GL52

Double and single engagement slide couplings are used for applications requiring axial movement to accommodate thermal shaft expansion or adjustment. (See **page 24, 25 and 38.**)

## Falk Lifelign Gear Coupling Application Guide

Types G70 & G72

Type G70 disconnect couplings are used for low-speed applications that require quick disconnect of equipment or inching drives. It is used for occasional servicing or inspection of drive system components and is most commonly used on portable or stationary inching drive systems where the driving end hub/sleeve combination is mounted on the driving shaft on the incher for connecting or disconnecting at standstill. (See **pages 26 and 39.**)

Type G72 disconnect couplings were designed for higher speed applications that require quick disconnect such as backup drives. When the long flex hub is mounted on the auxiliary driving shaft, the changeover is performed at standstill by engaging the free-running hub. (See **page 27.**)

Types GP20, 52 & 82

Double, single or rigid engagement insulated couplings are used to eliminate the flow of stray current from one shaft to another and to protect sensitive electrical equipment. They are not intended to withstand high potential currents, short circuits or static charges. Insulated couplings consist of standard hubs and sleeves and utilize reduced diameter socket head cap screws. The insulator plate is made of a NEMA Grade LE phenolic material, and insulator bushings and washers are made of NEMA Grade G9 phenolic material. (See **page 28.**)

Type G82 & GV82

Rigid couplings are used when there is no need to accommodate misalignment, and where thrust loads are generated, such as vertical mixer applications. (See **page 29, 30 and 40.**)

Type GR20

Shear pin couplings are used for applications subject to jamming and overload. When pins break, the equipment is physically disconnected, preventing damage. If desired shear settings are unknown, the selection should be referred to the Factory. (See **pages 31 and 41.**)

## How to Select

### Standard Selection Method

The standard selection method can be used for most motor, turbine or engine-driven applications. The following information is required to select a gear coupling:

- Horsepower or torque.
- Running rpm.
- Application or type of equipment to be connected (motor to pump, gear drive to conveyor, etc.).
- Shaft diameters.
- Shaft gaps.
- Physical space limitations.
- Special bore or finish information and type of fit.

**Exceptions are high peak loads, brake applications or high frequency axial sliding (greater than 5 per hour). For these conditions, use the Formula Selection Method on the next page. Applications that require rapid changes in direction or torque reversals should be referred to the Factory.**

1. **Rating:** Determine system torque. If torque is not given, calculate as shown below:

$$\text{System Torque (lb-in)} = \frac{\text{HP} \times 63,000}{\text{RPM}}$$

Where: HP (Horsepower) is the actual or transmitted power required by the application (if unknown, use the motor or turbine nameplate rating) and RPM is the actual speed the coupling is rotating.

2. **Service Factor:** Determine the appropriate service factor from **Table 4 and Table 5, page 10** or **Table 6, page 11**.
3. **Required Minimum Coupling Rating:** Determine the required minimum coupling rating as shown below:  
Minimum Coupling Rating = S.F. (Service Factor) x Torque (lb-in)
4. **Type:** Refer to **pages 3-5** and select the appropriate coupling type.
5. **Size:** Determine proper size of type selected from **Table 1** by tracing down the torque column to a value that is equal or greater than that determined in Step 3 above. Then turn to the dimension pages of the appropriate coupling type selected and check the following for the size selected.
6. **Check:** Coupling capacities and dimensions.
  - A. Bores — Check shaft diameters against coupling maximum bore. If bore is inadequate, consider the use of a reduced key from engineering tables, or select a larger size coupling.
  - B. Speeds (rpm) — Check the operating rpm against the coupling allowable speed. If cataloged values are inadequate, consider balancing. Balancing may allow up to a 50% increase in the speeds shown. Contact the Factory with complete application details. Check I & M manual or Factory for minimum speed recommendation for NLGI1 greases like LTG.
  - C. Dimensions — Checks are: length of hubs and alignment clearances against shaft lengths, outside diameter of coupling against radial clearances.

### Standard Selection Example:

Select a gear coupling to connect a 500 hp, 1170 rpm electric motor to a drive high-speed shaft of a maneuvering winch. Maximum shaft separation is 0.250". Motor shaft diameter is 3.375" and keyway is 0.875" x 0.438". Winch shaft diameter is 3.000" and keyway is 0.750" x 0.375". Motor and winch extensions are both 6.000" long.

1. **Determine Required Rating:**

$$\text{System Torque (lb-in)} = \frac{500 \text{ HP} \times 63,000}{1170 \text{ RPM}} = 26,923$$

2. **Service Factor:** From Service Factor **Table 4, page 10** = 1.5.

3. **Required Minimum Coupling Rating:**

$$1.5 \times 26,923 \text{ lb-in} = 40,385 \text{ lb-in}$$

4. **Type:** From **page 3**, to connect close-coupled shafts (0.250" gap) the double engagement Type 1025GC02 or Type 1025G20 coupling is the selection. Refer to **page 12** or **page 15** for dimensions.
5. **Size:** From **page 12**, a Size 1025GC02 or **page 15**, a Size 1025G20 is the proper selection based on a torque rating of 66,150 lb-in exceeding the required minimum coupling rating of 40,385 lb-in.
6. **Check:** Maximum speed capacity of 3,330 (1025GC02) and 5000 (1025G20) rpm exceeds required speed of 1170 rpm. Maximum bore capacity of 3.625" exceeds the actual shaft diameters.

**Table 1 — Torque and Horsepower Ratings**

Coupling Size	Torque Rating (lb-in)	HP per 100 RPM
1010G/GC	10,080	16
1015G/GC	20,790	33
1020G/GC	37,800	60
1025G/GC	66,150	105
1030G/GC	107,100	170
1035G/GC	163,800	260
1040G	270,900	430
1045G	371,700	590
1050G	500,900	795
1055G	655,200	1,040
1060G	800,100	1,270
1070G	1,197,000	1,900

Coupling Size		Torque Rating (lb-in – millions)		HP per 100 RPM	
		1000 Series	2000 Series	1000 Series	2000 Series
1080G	2080G	1.506	2.070	2,390	3,285
1090G	2090G	1.997	2.791	3,170	4,430
1100G	2100G	2.747	3.919	4,360	6,220
1110G	2110G	3.654	5.393	5,800	8,560
1120G	2120G	4.914	6.880	7,800	10,920

1140G	2140G	8.064	10.080	12,800	16,000
1150G	2150G	9.702	11.970	15,400	19,000
1160G	2160G	11.592	14.490	18,400	23,000
1180G	2180G	14.679	18.900	23,300	30,000
1200G	2200G	18.963	25.200	30,100	40,000
1220G	2220G	24.066	31.500	38,200	50,000
1240G	2240G	30.744	39.690	48,800	63,000
1260G	2260G	39.753	48.510	63,100	77,000
1280G	2280G	51.660	59.850	82,000	95,000
1300G	2300G	59.850	72.450	95,000	115,000

## How to Select

### Formula Selection Method

The Standard Selection Method can be used for most coupling selections. The procedure below should be used for:

- High Peak Loads
- Brake Applications (Where the disc brake or brakewheel is to be an integral part of the coupling, consult the Factory for design options.)
- High Frequency Axial Sliding
- Shear Pin Couplings

Providing system peak torque and frequency, duty cycle and brake torque rating will allow for a more refined selection using the Formula Selection Method.

1. **High Peak Loads:** Use one of the following formulas for applications using motors with torque characteristics that are higher than normal; applications with intermittent operations, shock loading, inertia effects due to starting and stopping and or system-induced repetitive high peak torques. System Peak Torque is the maximum torque that can exist in the system. Select a coupling with a torque rating equal to or greater than selection torque calculated below.

A. Non-Reversing High Peak Torque

Selection Torque (lb-in) = System Peak Torque

or

$$\text{Selection Torque (lb-in)} = \frac{\text{System Peak HP} \times 63,000}{\text{RPM}}$$

B. Reversing High Peak Torque

Selection Torque (lb-in) = 1.5 x System Peak Torque

or

$$\text{Selection Torque (lb-in)} = \frac{1.5 \times \text{Peak HP} \times 63,000}{\text{RPM}}$$

C. Occasional Peak Torques (Non-reversing) — If a system peak torque occurs less than 1000 times during the expected coupling life, use the following formula:

Selection torque (lb-in) = 0.5 x System Peak Torque

or

$$\text{Selection Torque (lb-in)} = \frac{0.5 \times \text{Peak HP} \times 63,000}{\text{RPM}}$$

For reversing service, select per Step B, above.

2. **Brake Applications:** If the torque rating of the brake exceeds the motor torque, use the brake rating as follows:

Selection Torque (lb-in) = Brake Torque Rating x S.F.

3. **High Frequency Axial Sliding:** For Type GL coupling, if axial movement occurs more than 5 times per hour, add 0.25 to the service factor.

$$\text{Selection Torque (lb-in)} = \frac{\text{HP} \times 63,000 \times (\text{S.F.} + 0.25)}{\text{RPM}}$$

4. **Shear Pin Couplings:** When selecting Type GR couplings, make certain that the required shear torque is within the minimum/maximum range for the coupling size selected. Refer to **pages 31 and 41**.

The user-provided shear torque value must be based on a system analysis. It is recommended that the shear torque value be at least 225% of the normal transmitted torque value for non-reversing applications to avoid breaking the shear pins due to fatigue during motor start-up. For reversing applications, the recommended shear torque setting is 300-400% of normal torque to avoid fatigue failures. If the connected equipment cannot tolerate these torque levels, expect to replace the shear pins more frequently.

### Formula Selection Example — High Peak Load:

Select a gear coupling to connect a gear drive low-speed shaft to a reversing runout mill table. The electric motor rating is 50 hp at its base speed and the system peak torque at the coupling is estimated to be 150,000 lb-in. The coupling speed is 77 rpm at the motor base speed. Drive shaft diameter is 4.000" and keyway is 1.000" x 0.500". Runout table roll diameter is 5.250" and keyway is 1.250 x 0.625". Shaft separation is 0.500" maximum. Motor and drive shaft extensions are both 7.00" long.

1. **Type:** From **page 3**, to connect close-coupled shafts (0.50" gap), the double engagement Type G20 coupling is the selection.
2. **Required Minimum Coupling Rating:**  
Use the Reversing High Peak Torque formula in Step 1B.  
 $1.5 \times 150,000 = 225,000$  Selection Torque
3. **Size:** From **Table 1**, Size 1040G20 coupling with torque rating of 270,900 exceeds the selection torque of 225,000 lb-in.
4. **Check:** The maximum bore of 5.75", from **Table 13, page 43**, the allowable speed of 3600 and Dimension M of 5.70" on **page 15** meet the requirements.

## Quick Selection Method

### 1. Select Coupling Type.

The Type G20 coupling is the proper selection for most industrial applications. For quick disconnect couplings, especially suited for pump applications, consider the Type G32 spacer coupling. If an application requires a special purpose coupling, refer application details to the local Rexnord representative.

### 2. Determine Service Factor.

- For motor, turbine or engine-driven applications, refer to **Table 4** and **Table 5** on **page 10**.
- For brake, high peak load and Type GL slide coupling applications, refer to Formula Selection Method on **page 7**.

### 3. Determine Equivalent Horsepower.

Refer to **Table 2** below. Under the actual motor hp required and opposite the service factor determined in Step 2, read the equivalent hp.

### 4. Determine Coupling Size.

- Refer to **Table 3, page 9**. Trace horizontally from the required speed to a value equal to or larger than the equivalent horsepower determined in Step 3. Read the coupling size at the top of the column.
- Check shaft diameters against coupling maximum bores. If a larger bore is required, select a larger coupling.

- Check the required speed against the allowable speed of the coupling selected. If a higher speed is required, refer complete details to the local Rexnord representative.
- Check dimensions ... Dimension M in particular.

#### Example:

Select a gear coupling to connect a 450 hp, 1170 rpm electric motor to a gear drive high-speed shaft of a maneuvering winch. Maximum shaft separation is 0.250". Motor shaft diameter is 3.500" and the gear drive shaft is 3.000". Motor and gear drive shaft extensions are both 6.00" long.

#### Selection:

- To connect close-coupled shafts (0.250" gap) and to accommodate anticipated shaft misalignment, the double engagement Type G20 coupling shown on **page 15** is the selection.
- From **Table 4** on **page 10**, the Service Factor is 1.5.
- From **Table 2** below, the equivalent hp is 675.
- From **Table 3, page 9**, the coupling size is 1025G for 1170 rpm and equivalent hp of 675. From the table on **page 15**, the maximum bore of 3.625", allowable speed of 5000 rpm and Dimension M of 3.60" are all satisfactory.

**Table 2 — Equivalent Horsepower = (Actual HP x Service Factor)**

Service Factor ①	Actual HP																									
	3/4	1	1-1/2	2	3	5	7-1/2	10	15	20	25	30	40	50	60	75	100	125	150	200	250	300	350	400	450	500

# Service Factors

**Table 4 — Flexible Coupling Service Factors for Motor ① and Turbine Drives**

Service factors listed are typical values based on normal operation of the drive systems.

Application	Service Factor	Application	Service Factor
<b>AERATOR</b> .....	2.0	<b>HAMMERMILL</b> .....	1.75
<b>AGITATORS</b>		<b>LAUNDRY WASHER OR TUMBLER</b> .....	2.0
Vertical and Horizontal		<b>LINE SHAFTS</b>	
Screw, Propeller, Paddle.....	1.0	Any Processing Machinery.....	1.5
<b>ARGE HAUL PULLER</b> .....	1.5	<b>MACHINE TOOLS</b>	
<b>BLOWERS</b>		Auxiliary and Traverse Drive.....	1.0
Centrifugal.....	1.0	Bending Roll, Notching Press, Punch Press,	
Lobe or Vane.....	1.25	Planer, Plate Reversing.....	1.75
<b>CAR DUMPERS</b> .....	2.5	Main Drive.....	1.5
<b>CAR PULLERS</b> .....	1.5	<b>MAN LIFTS</b> .....	<b>Not Approved</b>
<b>CAR SHREDDER</b> .....	3.0	<b>METAL FORMING MACHINES</b>	
<b>CLARIFIER OR CLASSIFIER</b> .....	1.0	Continuous Caster.....	1.75
<b>COMPRESSORS</b>		Draw Bench Carriage and Main Drive.....	2.0
Centrifugal.....	1.0	Extruder.....	2.0
Rotary, Lobe or Vane.....	1.25	Farming Machine and Forming Mills.....	2.0
Rotary, Screw.....	1.0	Slitters.....	1.0
Reciprocating.....		Wire Drawing or Flattening.....	1.75
Direct Connected.....	Refer to Factory	Wire Winder.....	1.5
Without Flywheel.....	Refer to Factory	Coilers and Uncoilers.....	1.5
② With Flywheel and Gear between Compressor and Prime Mover		<b>MIXERS (see Agitators)</b>	
1 cylinder, single acting.....	3.0	Concrete.....	1.75
1 cylinder, double acting.....	3.0	Muller.....	1.5
2 cylinders, single acting.....	3.0	<b>PRESS, PRINTING</b> .....	1.5
2 cylinders, double acting.....	3.0	<b>PUG MILL</b> .....	1.75
3 cylinders, single acting.....	3.0	<b>PULVERIZERS</b>	
3 cylinders, double acting.....	3.0	Hammermill and Hog.....	1.75
4 or more cyl., single act.....	1.75	Roller.....	1.5
4 or more cyl., double act.....	1.75	<b>PUMPS</b>	
<b>③ CONVEYORS</b>		Boiler Feed.....	1.5
Apron, Assembly, Belt, Chain, Flight, Screw.....	1.0	Centrifugal — Constant Speed.....	1.0
Bucket.....	1.25	Frequent Speed Changes under Load.....	1.25
Live Roll, Shaker and Reciprocating.....	3.0	Descaling, with accumulators.....	1.25
<b>③④ CRANES AND HOIST</b>		Gear, Rotary, or Vane.....	1.25
Main Hoist.....	1.7 ③	Reciprocating, Plunger Piston	
Skip Hoist.....	1.75 ③	1 cyl., single or double act.....	3.0
Slope.....	1.5	2 cyl., single acting.....	2.0
Bridge, Travel or Trolley.....	1.75	2 cyl., double acting.....	1.75
<b>DYNAMOMETER</b> .....	1.0	3 or more cylinders.....	1.5
<b>ELEVATORS</b>		Screw Pump, Progressing Cavity.....	1.25
Bucket, Centrifugal Discharge.....	1.25	Vacuum Pump.....	1.25
Freight or Passenger.....	<b>Not Approved</b>	<b>SCREENS</b>	
Gravity Discharge.....	1.25	Air Washing.....	1.0
<b>ESCALATORS</b> .....	<b>Not Approved</b>	Grizzly.....	2.0
<b>EXCITER, GENERATOR</b> .....	1.0	Rotary Coal or Sand.....	1.5
<b>EXTRUDER, PLASTIC</b> .....	1.5	Vibrating.....	2.5
<b>FANS</b>		Water.....	1.0
Centrifugal.....	1.0	<b>SKI TOWS &amp; LIFTS</b> .....	<b>Not Approved</b>
Cooling Tower.....	2.0	<b>STEERING GEAR</b> .....	1.0
Forced Draft — Across the Line start.....	1.5	<b>STOKER</b> .....	1.0
Forced Draft Motor driven thru fluid or electric slip clutch.....	1.0	<b>TIRE SHREDDER</b> .....	1.50
Gas Recirculating.....	1.5	<b>TUMBLING BARREL</b> .....	1.75
Induced Draft with damper control or blade cleaner.....	1.25	<b>WINCH, MANEUVERING</b>	
Induced Draft without controls.....	2.0	Dredge, Marine.....	1.5
<b>FEEDERS</b>		<b>WINDLASS</b> .....	1.5
Apron, Belt, Disc, Screw.....	1.0	<b>WOODWORKING MACHINERY</b> .....	1.0
Reciprocating.....	2.5	<b>WORK LIFT PLATFORMS</b> .....	<b>Not Approved</b>
<b>GENERATORS</b>			
Even Load.....	1.0		
Hoist or Railway Service.....	1.5		
Welder Load.....	2.0		

- ① Add 0.25 to the required service factor for Type GL slide coupling applications where axial movement occurs more than 5 times per hour. When electric motors, generators, engines, compressors and other machines are fitted with sleeve or straight roller bearings, use limited axial end float couplings to protect the bearings. Order limited end float discs with the coupling.
- ② For balanced opposed design, refer to the Factory.
- ③ If people are occasionally transported, refer to the Factory for the selection of the proper size coupling.
- ④ For high peak load applications (such as Metal Rolling Mills) refer to the Factory.

**Table 5 — Engine Drive Service Factors ①**

Service Factors (S. F.) for engine drives are those required for applications where good flywheel regulation prevents torque fluctuations greater than ±20%. For drives where torque fluctuations are greater or where the operation is near a serious critical or torsional vibration, a mass elastic study is necessary.

No. of Cylinders	4 or 5 ①					6 or more ①				
	1.0	1.25	1.5	1.75	2.0	1.0	1.25	1.5	1.75	2.0
<b>Table 4 S.F.</b>	1.0	1.25	1.5	1.75	2.0	1.0	1.25	1.5	1.75	2.0
<b>Engine S.F.</b>	2.0	2.25	2.5	2.75	3.0	1.5	1.75	2.0	2.25	2.5

- ① To use **Table 5**, first determine application service factor from **Table 4**. Use that factor to determine Engine Service Factor from **Table 5**. When service factor from **Table 4** is greater than 2.5, refer complete application details to the Factory for engineering review.

Industry	Service Factor	Industry	Service Factor
<b>AGGREGATE PROCESSING, CEMENT, MINING KILNS; TUBE, ROD AND BALL MILLS</b>		Shear, Croppers.....	Refer to Factory
Direct or on L. S. shaft of Reducer, with final drive Machined Spur Gears.....	2.0	Sideguards.....	3.0

Cutter head, Jig Drive.....	2.0	Cast Tooth Spur Gear.....	3.0
Maneuvering Winch.....	1.5	Beater & Pulper.....	1.75
Pumps (uniform load).....	1.5	Bleachers, Coaters.....	1.0
Screen Drive, Stacker.....	1.75	Calender & Super Calender.....	1.75
Utility Winch.....	1.5	Chipper.....	2.5
<b>FOOD INDUSTRY</b>		Converting Machine.....	1.25
Beet Slicer.....	1.75	Couch.....	1.75
Bottling, Can Filling Machine.....	1.0	Cutter, Felt Whipper.....	2.0
Cereal Cooker.....	1.25	Cylinder.....	1.75
Dough Mixer, Meat Grinder.....	1.75	Dryer.....	1.75
<b>LUMBER</b>		Felt Stretcher.....	1.25
Band Resaw.....	1.5	Foudrinier.....	1.75
Circular Resaw, Cut-off.....	1.75	Jordan.....	2.0
Edger, Head Rig, Hog.....	2.0	Log Haul.....	2.0
Gang Saw (Reciprocating).....	Refer to Factory	Line Shaft.....	1.5
Log Haul.....	2.0	Press.....	1.75
Planer.....	1.75	Pulp Grinder.....	1.75
Rolls, Non-Reversing.....	1.25	Reel, Rewinder, Winder.....	1.5
Rolls, Reversing.....	2.0	Stock Chest, Washer, Thickener.....	1.5
Sawdust Conveyor.....	1.25	Stock Pumps, Centrifugal	
Slab Conveyor.....	1.75	Constant Speed.....	1.0
Sorting Table.....	1.5	Frequent Speed Changes Under Load.....	1.25
Trimmer.....	1.75	Suction Roll.....	1.75
<b>④ METAL ROLLING MILLS</b>		Vacuum Pumps.....	1.25
Coilers (Up or Down) Cold Mills only.....	1.5	<b>RUBBER INDUSTRY</b>	
Coilers (Up or Down) Hot Mills only.....	2.0	Calendar.....	2.0
Coke Plants		Cracker, Plasticator.....	2.5
Pusher Ram Drive.....	2.5	Extruder.....	1.75
Door Opener.....	2.0	Intensive or Banbury Mixer.....	2.5
Pusher or Larry Car Traction Drive.....	3.0	Mixing Mill, Refiner or Sheeter	
Continuous Caster.....	1.75	One or two in line.....	2.5
Cold Mills — Strip Mills.....	Refer to Factory	Three or four in line.....	2.0
Temper Mills.....	Refer to Factory	Five or more in line.....	1.75
Cooling Beds.....	1.5	Tire Building Machine.....	2.5
Drawbench.....	2.0	Tire & Tube Press Opener (Peak Torque).....	1.0
Feed Rolls - Blooming Mills.....	3.0	Tuber, Strainer, Pelletizer.....	1.75
Furnace Pushers.....	2.0	Warming Mill	
Hot and Cold Saws.....	2.0	One or two Mills in line.....	2.0
Hot Mills —		Three or more Mills in line.....	1.75
Strip or Sheet Mills.....	Refer to Factory	Washer.....	2.5
Reversing Blooming.....	Refer to Factory	<b>SEWAGE DISPOSAL EQUIPMENT</b>	
Slabbing Mills.....	Refer to Factory	Bar Screen, Chemical Feeders, Collectors, Dewatering Screen, Grit Collector.....	1.0
Edger Drives.....	Refer to Factory	<b>SUGAR INDUSTRY</b>	
Ingot Cars.....	2.0	Cane Carrier & Leveler.....	1.75
Manipulators.....	3.0	Cane Knife & Crusher.....	2.0
Merchant Mills.....	Refer to Factory	Mill Stands, Turbine Drive with all Helical or Herringbone gears.....	1.5
Mill Tables		Electric Drive or Steam Engine Drive with Helical, Herringbone, or Spur Gears	
Roughing Breakdown Mills.....	3.0	with any Prime Mover.....	1.75
Hot Bed or Transfer, non-reversing.....	1.5	<b>TEXTILE INDUSTRY</b>	
Runout, reversing.....	3.0	Batcher.....	1.25
Runout, non-reversing, non-plugging.....	2.0	Calendar, Card Machine.....	1.5
Reel Drives.....	1.75	Cloth Finishing Machine.....	1.5
Rod Mills.....	Refer to Factory	Dry Can, Loom.....	1.5
Screwdown.....	2.0	Dyeing Machinery.....	1.25
Seamless Tube Mills		Knitting Machine.....	Refer to Factory
Piercer.....	3.0	Mangle, Napper, Soaper.....	1.25
Thrust Block.....	2.0	Spinner, Tenter Frame, Winder.....	1.5
Tube Conveyor Rolls.....	2.0		
Reeler.....	2.0		
Kick Out.....	2.0		

## Service Factors

**SERVICE FACTORS** are a guide, based on experience, of the ratio between coupling catalog rating and system characteristics. The system characteristics are best measured with a torque meter.

**Table 6 — Service Factors**

Torque Demands Driven Machine	Typical applications for electric motor or turbine driven equipment	Typical Service Factor
	Constant torque such as Centrifugal Pumps, Blowers and Compressors.	1.0
	Continuous duty with some torque variations including Plastic Extruders, Forced Draft Fans.	1.5
	Light shock loads from Metal Extenders, Cooling Towers, Cane Knife, Log Haul.	2.0
	Moderate shock loading as expected from a Car Dumper, Stone Crusher, Vibrating Screen.	2.5
	Heavy shock load with some negative torques from Roughing Mills, Reciprocating Pumps, Compressors, Reversing Runout Tables.	3.0
	Applications like Reciprocating Compressors with frequent torque reversals, which do not necessarily cause reverse rotations.	Refer to Factory

## Products

### Safety Notes

Install and operate Rexnord® products in conformance with applicable local and national safety codes and per Rexnord installation manuals which are available upon request. Suitable guards for rotating members may be purchased from Rexnord as optional accessories. Consult your local Rexnord representative for complete details.

**WARNING:** Lock out power and remove all external loads from the system before attempting to service any component in the system. Locking out the power and removing the load will reduce the possibility of unexpected motion or reaction in the system.

**Falk Long Term Grease (LTG)** — Benefits include: increased coupling life, significantly extended re-lubrication intervals, reduced maintenance costs, reduced downtime, superior lubrication, high load-carrying capabilities and it is usable up to 250°F (121°C).

For information on Falk LTG, request Form 840201B. Lifalign gear couplings are warranted for 3 years when lubricated with Falk LTG.

## How to Order

The following information is necessary to quote or ship to your exact requirements. Prompt service is assured if this information is given on your inquiry or order.

1. Application: Driver & Driven
2. Power: Normal hp, Maximum hp or Torque (lb-in)
3. Speed (rpm)
4. Quantity
5. Coupling Size and Type, Horizontal, Vertical; e. g., Size 1010, Type G20
6. Shaft gap or distance between shaft ends (BE Dimension)
7. Bore Sizes will be furnished as per **Table 38** on **page 53** unless specified differently.
8. Shaft Dimensions as follows:

### For Straight Shafts:

Driving Shaft	Driven Shaft
Diameter U _____	Diameter U _____
Length V _____	Length V _____
Keyway _____	Keyway _____

**NOTE:** Provide shaft tolerances if different than those shown in **Table 24**, on **page 48**. For other shaft/bore requirements, consult Rexnord.

### For Taper Shafts:

Diameter U _____	Across Flats _____
Length V _____	Corners ZW _____
Length W _____	Taper per Foot _____
Length X _____	Keyway _____
Length Y _____	

### Warranty

We're so confident in the performance and reliability of our latest generation of Falk gear drives that we're backing this comprehensive offering with the best standard warranty in the business. Our full, 3-year Heavy-Duty Warranty provides "shaft-to-shaft" protection on all Falk components – including bearings and seals. It's an industry first... and one more powerful reason why Rexnord is your ultimate bottom-line drive and coupling value.<sup>①</sup>

① Warranty extends for 3 years from date of shipment.

### General Information

- Rexnord standards apply unless otherwise specified.
- Dimensions are for reference only and are subject to change without notice unless certified.
- Unless otherwise specified, Rexnord coupling hubs will be bored for an interference fit without a setscrew. Clearance fit hubs with a setscrew can be supplied if specified.

## Type GC02 Continuous Sleeve Double Engagement

1035GC	163,800	2,600	4.875	2.00	114	4.3	8.50	8.63	4.19	7.00	5.25	5.50	0.250

① See **page 11** for General Information.

② Peak torque capacity is two times the published rating.

③ Consult Factory for higher speeds. Balancing may allow up to a 50% increase in speeds shown.

④ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to **Table 13 and Table 14** on **page 43**. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in **Table 37, page 52**.

⑤ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

① See page 11 for General Information.

② Limited by coupling size, shaft end diameter or both. Refer to page 18 for selection procedure.

③ Interpolate for intermediate speeds. Maximum BE is based on 70% of critical speed. Refer to the Factory for higher running speeds.

④ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52.

⑤ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

- ① Refer to the Factory if these values exceed one-half the rotor end float or the equipment manufacturer's specifications.
- ② Couplings with stock spacers and limited end float must add applicable addition to the BE (Between Shaft Ends) dimension.
- ③ See **page 11** for General Information.
- ④ BE is the distance between shaft ends whether standard (stock) or special spacer lengths are used.
- ⑤ Peak torque capacity is two times the published rating.
- ⑥ Consult Factory for higher speeds. Balancing may allow up to a 50% increase in speeds shown.
- ⑦ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to **Table 13 and Table 14 on page 43**. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in **Table 37, page 52, and Table 23, page 47**.
- ⑧ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.
- ⑨ Bolt holes staggered for assembly clearance.

# Type G52 Standard Flanged Sleeve Single Engagement

① See page 11 for General Information.

② Peak torque capacity is two times the published rating.

③ Consult Factory for higher speeds. Balancing may allow up to a 50% increase in speeds shown.

④ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

⑤ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

# Type G52 Standard Flanged Sleeve Single Engagement

## Floating Shaft/Dimensions (in)

A standard floating shaft assembly consists of two standard single engagement couplings, two gap discs and a connecting shaft.

A floating shaft can eliminate the need for additional bearing supports along spanning shafts, because shaft is supported at ends by connected equipment through the single engagement couplings.

### Flex Hubs on Floating Shaft (RFFR)

Assembly of the flex hubs on the floating shaft allows for easier replacement in case of wear and allows the rigid hubs with their increased bore capacity to be used on the connected equipment shafts. This frequently means a smaller coupling size can be used.

### Rigid Hubs on Floating Shaft (FRRF)

When the rigid hubs are on the floating shaft, shorter shaft spans can be accommodated, since no cover drawback is required. Since the flex hubs are outboard, the points of articulation are further apart, providing greater offset misalignment capacity.

### Solid Floating Shaft Selection

Single Engagement Type G52/GV52 couplings are used with floating shafts in either horizontal or vertical applications. For vertical applications, select a Type GV coupling for the lower coupling assembly. Select floating shafts as follows:

1. Use the Standard or Formula Selection Methods, **pages 6 and 7** to select the couplings. Record the System Torque from standard selection method or Selection Torque from formula selection method.
2. From the table below, select a shaft diameter that has an assembly torque rating equal to or greater than the system or selection torque determined in coupling selection.
3. Check maximum "BE" for the shaft diameter selected and running speed for the shaft length required from the table below. Refer to the graph at left to determine if the shaft requires balancing.
4. If the application shaft length exceeds the maximum "BE" listed, select the next larger shaft diameter or the next larger size coupling. Consult the Factory for higher speeds or longer shaft lengths than listed below.

① See page 11 for General Information.

② Assembly torque rating is limited by coupling size, shaft end diameter or both.

③ Interpolate for intermediate speeds. Maximum BE is based on 70% of critical speed. Refer to the Factory for higher running speeds.

① See page 11 for General Information.

② Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

③ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

① See page 11 for General Information.

② Peak torque capacity is two times the published rating.

③ Consult Factory for higher speeds. Balancing may allow up to a 50% increase in speeds shown.

④ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

⑤ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

- ① See page 11 for General Information.
- ② Maximum rim velocity is 6000 feet per minute. Brakewheel must be balanced if peripheral speed exceeds 6000 feet per minute.
- ③ Dimensions and allowable speed vary with application; consult the Factory.
- ④ Dimensions AC and JC depend upon customer caliper specifications.
- ⑤ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.
- ⑥ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.
- ⑦ Also available in G67 disc configuration.

# Types G62/G66 Standard Flanged Sleeve Brakewheel (for AISE Brakes)

## Taper Bores — Wheel Sizes 8" – 30" Diameter & Larger

**Double Engagement Type G62  
(One Hub Taper Bored)  
Figure X**

**Single Engagement Type G66  
(Flex Hub Taper Bored)  
Figure Y**

**Single Engagement Type G66  
(Rigid Hub Taper and C' Bored)  
Figure Z**

- ① See page 11 for General Information.
- ② For standard AISE brakes.
- ③ Based on maximum rim velocity of 6000 feet per minute.
- ④ Dimension NB and the brakewheel centerline are to the left of the hub face.

# Type GL20 Standard Flanged Sleeve Slide Double Engagement

**Type GL20-1**  
**Long Tooth Sleeve**  
**Reversed Std. Hubs**  
**Center Plate**

**Type GL20-2**  
**Long Tooth Sleeves**  
**Cutoff Long Hubs**  
**Center Plate**

**Type GL20-4**  
**Std. Tooth Sleeves**  
**Reversed Std. Hubs**  
**Center Plate**

## Choosing an Assembly

Select the assembly that provides a Total "T" dimension from the table below equal to the application requirements.

- GL20-1 Moderate slide capacity, moderate price.
- GL20-2 Greatest slide capacity, highest price.
- GL20-4 Least slide capacity, lowest price.

- ① See page 11 for General Information.
- ② Gap discs are not required for Sizes 1010 and 1020GL.
- ③ Peak torque capacity is two times the published rating.
- ④ Consult Factory for higher speeds. Balancing may allow up to a 50% increase in speeds shown.
- ⑤ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.
- ⑥ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

# Type GL52 Standard Flanged Sleeve Slide Single Engagement

**Type GL52-1 Long Tooth Sleeve  
Reversed Std. Hub**

**Type GL52-2 Long Tooth Sleeve  
Cutoff Long Hub**

## Choosing an Assembly

Select the assembly that provides a Total "T" dimension from the table below equal to the application requirements.

- GL52-1 — Moderate slide capacity, moderate price.
- GL52-2 — Greatest slide capacity, highest price.

① See page 11 for General Information.

② Peak torque capacity is two times the published rating.

③ Consult Factory for higher speeds. Balancing may allow up to a 50% increase in speeds shown.

④ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

⑤ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

# Type G70 Disconnect (Inching Drives)

Optional hand-operated shifter mechanism to shift and secure the proper position of the sleeve assembly.

④ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

⑤ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

# Type G72 Disconnect

Optional hand-operated shifter mechanism to shift and secure the proper position of the sleeve assembly.

## Type GV82 Standard Flanged Sleeve Rigid Thrust

Type GV82 couplings are used as rigid connections for the low-speed shaft of a gear drive and a mixer shaft or suspended load. The coupling carries the torque load, weight of the shaft and impeller, thrust forces and resulting bending moments.

When a rigid coupling is required, the following additional information is necessary.

1. Required thrust capacity and direction of thrust.
2. Radial force at impeller.
3. Distance from the center of coupling fastener flange to the center of the impeller.
4. Weight of shaft and impeller.

① See page 11 for General Information.

② Dowels: diameters, +.000", -.001" material, AISI 4140 hardness, 310-350 HB; furnished by the Factory. Customer is responsible for checking and furnishing driven shaft with satisfactory capacity.

③ Peak torque capacity is two times the published rating.

④ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

- ① See page 11 for General Information. Minimum and maximum bores are the same as those for Type G20, page 15.
- ② Peak torque capacity is two times the published rating.
- ③ Consult Factory for higher speeds. Balancing may allow up to a 50% increase in speeds shown.
- ④ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.
- ⑤ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

① See page 11 for General Information.

② Reduced shank diameter hubs are available where required bore permits. See Table 32, page 50 for selection.

③ Dimension K may be an "as-cast" surface, depending upon coupling size and bore.

④ Peak torque capacity is two times the published rating.

⑤ Consult Factory for higher speeds. Balancing may allow up to a 50% increase in speeds shown.

⑥ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

⑦ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

- ① See page 11 for General Information.
- ② Reduced shank diameter hubs are available where required bore permits. See Table 32, page 50 for selection.
- ③ Dimension K may be an "as-cast" surface, depending upon coupling size and bore.
- ④ The allowable speed for floating shaft assemblies is the smaller value of either the critical speed of the selected shaft or the cataloged speed of the selected size coupling. The allowable operating speed should be based on torque, misalignment, balance and other operating requirements for the specific application. If higher speeds are required or special application requirements must be met, consult the Factory for assistance.
- ⑤ Peak torque capacity is two times the published rating.
- ⑥ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

NOTE: Dimensions subject to change. Certified dimensions of ordered material furnished on request.

① See page 11 for General Information.

② Reduced shank diameter hubs are available where required bore permits. See Table 32, page 50 for selection.

③ Peak torque capacity is two times the published rating.

④ Consult Factory for higher speeds. Balancing may allow up to a 50% increase in speeds shown.

⑤ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

⑥ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

# Type GV52 Large Flanged Sleeve Vertical Single Engagement

**IMPORTANT:** When couplings are mounted on a floating shaft, do not exceed allowable shaft speed for the assembly.

- ① See page 11 for General Information. Downward thrust capacity of lower supporting button for Sizes 1080 and larger is 87,000 pounds.
- ② Reduced shank diameter hubs are available where required bore permits. See Table 32, page 50 for selection.
- ③ Dimension K may be an "as-cast" surface, depending upon coupling size and bore.
- ④ Peak torque capacity is two times the published rating.
- ⑤ Consult Factory for higher speeds. Balancing may allow up to a 50% increase in speeds shown.
- ⑥ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

① See page 11 for General Information.

② Peak torque capacity is two times the published rating.

③ Consult Factory for higher speeds. Balancing may allow up to a 50% increase in speeds shown.

④ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

⑤ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

# Type G70 Large Disconnect

Optional hand-operated shifter mechanism to shift and secure the proper position of the sleeve assembly.

① See page 11 for General Information.

② Maximum bores for standard keys recommended in Table 37.

③ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

④ Minimum bore is the smallest bore to which a Rough Stock Bore (RSB) hub can be bored. Depending upon coupling size, RSB hubs may have only a blind centering hole or a through hole that will permit remachining of the hubs to the minimum bores specified.

- ① See page 11 for General Information.
- ② To determine total WR<sup>2</sup> of spacer couplings with a BE (distance between shaft ends) greater than minimum:
  1. Subtract minimum BE from required BE.
  2. Multiply the result of Step 1 by the appropriate spacer WR<sup>2</sup> and add to coupling WR<sup>2</sup> at minimum BE.
- ③ Values apply to the tube portion only. Flange WR<sup>2</sup> is included in the spacer WR<sup>2</sup> for minimum BE.

④ Shallow keyway depths must be equal or exceed 2/3 of the full keyway depth of the square keys shown above.

# Engineering Data — Standard Flanged Sleeve & Continuous Sleeve

**Variable Gap** — Normally it is not necessary to overhang gear coupling hubs since the hubs can readily be reversed to produce different gap dimensions as illustrated in **Figures 1, 2 and 4** below. Also, long hubs from **Table 10, page 32**, can be cut off to suit required gap as illustrated in **Figures 3 and 5** below.

However when the distance between shafts is greater than the allowable coupling gap, overhang one or both hubs. It must be remembered that this practice reduces shaft-hub engagement. If the overhang with a standard hub results in less than 0.75 times the shaft diameter engagement, a coupling with long hubs is recommended. Use the standard interference fit and check key strength.

**CAUTION:** The effect of open keyways on coupling balance should always be considered.

If axial shaft movement is required, use the Type GL slide coupling.

Figure 1

Figure 2

Figure 3

Figure 4

Figure 5

**Misalignment Capacity** — Shaft misalignment can be due to the combined effects of both parallel and angular shaft displacement. Falk 1000 Series gear couplings are designed to accommodate a static misalignment of 1-1/2° per gear mesh. The recommended installation misalignment is limited to 1/8° per gear mesh. Axial movement of connected shafts is also accommodated.

It is important that flexible couplings are properly aligned so that the maximum benefits of the equipment can be obtained. These benefits include the following:

1. Longer coupling life with minimum maintenance.
2. Longer life of the connected equipment as a result of reduced bending moments and radial forces which are related to the amount of misalignment.
3. Permit drive systems to have reserve misalignment capacity to accommodate unavoidable alignment changes caused by bearing wear foundation settling, thermal expansion, etc.

Dimension Y must be equal to or greater than Dimension X times 0.75. If not, use long hubs.

③ These maximum operating alignment limits are each based on 3/4° per flex half coupling. Combined values of parallel and angular misalignment should not exceed 3/4°. Type GL slide couplings are limited to 1/4° per flex half.

④ Do not use single engagement couplings to compensate for parallel offset misalignment.

① See page 11 for General Information.

② See Table 32, page 50 for maximum bores of couplings with reduced shank diameter hubs.

③ Maximum bores for standard keys recommended in Table 23, page 47.

④ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required.

Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

Check Key Stresses

# Engineering Data — Large Flanged Sleeve

## Data for couplings with reduced shank diameter hubs:

Depending upon bore, a reduced shank diameter hub (Dimension “N” or “K”) is available for each coupling, sizes 1160/2160 thru 1300/2300. This provides reduced weight and WR<sup>2</sup>.

**Table 32 — Bore Ranges for Reduced Shank Diameter Hubs (in)**

① See page 11 for General Information.

② Hubs with the least possible “K” or “N” dimension for the required bore are normally furnished.

③ Total weight of coupling varies with “K” or “N” dimension of rigid and flex hub selection. Add weight of selected hubs to “Sleeve, End Ring and Fasteners” weight.

④ Maximum bores are reduced for hubs furnished with an interference fit and a setscrew over the keyway. Maximum bores may also be reduced when puller bolt holes are required. Refer to Table 13 and Table 14 on page 43. Bore capacities can be increased beyond values shown if the coupling torque rating is reduced. Refer to the Factory. Recommended key sizes for the listed maximum bores are shown in Table 37, page 52, and Table 23, page 47.

# Engineering Data — Large Flanged Sleeve

## Standard Filleted Keyways & Chamfered Keys

It is general practice in industry to supply coupling hubs with minimum fillet radii in the keyway corners to permit the use of standard commercial keys without chamfered edges. Rexnord will cut filleted keyways when specified in accordance with the established industry standards as shown in **Table 34** at no extra charge.

**Table 34 — Standard Filleted Keyways & Chamfered Keys (in)**

Normal Bore		Key		Hub Keyway			
Over	Thru	Size (Nominal)	45° Chamfer Suggested	Width	Depth ①	Fillet Radii

② These maximum operating alignment limits are each based on 3/8° per flex half coupling. Combined values of parallel and angular misalignment should not exceed 3/8°. Type GL slide couplings are limited to 1/4° per flex half. Application requirements in excess of these values should be referred to the Factory for review.

① Based on an average interference fit of 0.0005" per inch (0.5 mm per m) of shaft diameter. Tolerances and fits comply with, or are within AGMA 9002 standards.

② Rexnord gear couplings are supplied with an interference fit as a standard. Clearance fits can be provided on request.

## Lifalign Gear Coupling Nomenclature

### Type GC (pages 12-14 & pages 42-46)

**1010**

SIZE

**GC**

PRODUCT  
CLASSIFICATION

Gear — Continuous Sleeve

**02**

TYPE

GC02 = Double Engagement

GC05 = Single Engagement/Floating Shaft

### Type G (pages 15-32 and pages 42-46)

**1010**

SIZE

**G**

PRODUCT  
CLASSIFICATION

Gear — Standard Flanged Sleeve

**20**

TYPE (Shrouded and Exposed Bolts)

G10/20 = Double Engagement (Shrouded/Exposed)

G51/52 = Single Engagement/Floating Shaft (Shrouded/Exposed)

GV10/20 = Vertical Double Engagement (Shrouded/Exposed)

GV51/52 = Vertical Single Engagement/Floating Shaft (Shrouded/Exposed)

G62 = Brakewheel Double Engagement (Exposed)

G63 = Disc Brake Double Engagement (Exposed)

G66 = Brakewheel Single Engagement (Exposed)

GL20 = Slide Double Engagement (Exposed)

GL52 = Slide Single Engagement/Floating Shaft (Exposed)

G70 = Disconnect Inching Drives

G72 = Disconnect (Exposed)

G31/32 = Spacer (Shrouded/Exposed)

GP20 = Insulated Double Engagement (Exposed)

GP52 = Insulated Single Engagement/Floating Shaft (Exposed)

GP82 = Insulated Rigid (Exposed)

G81/82 = Rigid (Shrouded/Exposed)

GV82 = Vertical Rigid (Exposed)

GR20 = Shear Pin (Exposed)

### Type G (pages 33-41 and pages 47-52)

**1080**

SIZE

**G**

PRODUCT  
CLASSIFICATION

Gear — Large Flanged Sleeve

**20**

TYPE (Exposed Bolts Only)

Type G20 = Double Engagement

Type G52 = Single Engagement/Floating Shaft

Type GV20 = Vertical Double Engagement

Type GV52 = Vertical Single Engagement/Floating Shaft

Type GL20 = Slide Double Engagement

Type G70 = Disconnect/Inching Drives

Type G32 = Spacer

Type G82 = Rigid

Type GV82 = Vertical Rigid

Type GR20 = Shear Pin

① Based on the original Sier-Bath design. Component parts are interchangeable.

② Competitive complete half couplings are interchangeable because O.D., bolt circle, quantity and size are the same.

**IMPORTANT:** Exposed bolt sleeves will not mate to shrouded bolt designs regardless of the manufacturer. Shrouded bolt designs have a different bolt circle and a greater number of smaller diameter fasteners.

# Interchange Guide

## Why Choose Rexnord?

When it comes to providing highly engineered products that improve productivity and efficiency for industrial applications worldwide, Rexnord is the most reliable in the industry. Commitment to customer satisfaction and superior value extend across every business function.

### Delivering Lowest Total Cost of Ownership

The highest quality products are designed to help prevent equipment downtime and increase productivity and dependable operation.

### Valuable Expertise

An extensive product offering is accompanied by global sales specialists, customer service and maintenance support teams, available anytime.

### Solutions to Enhance Ease of Doing Business

Commitment to operational excellence ensures the right products at the right place at the right time.

## Rexnord Corporation

Rexnord is a growth-oriented, multi-platform industrial company with leading market shares and highly trusted brands that serve a diverse array of global end markets.

## Process and Motion Control

The Rexnord Process and Motion Control platform designs, manufactures, markets and services specified, highly engineered mechanical components used within complex systems where our customers' reliability requirements and the cost of failure or downtime are extremely high.

## Water Management

The Rexnord Water Management platform designs, procures, manufactures and markets products that provide and enhance water quality, safety, flow control and conservation.
